# Advice from a Windows Expert

**From:** Steve ██████████  
**Date:** May 8, 2016 at 10:27:50 AM CDT  
**To:** Steve ██████████  
**Subject:** FW: The occasional newsletter from Steve ██████████ you're computer tech...

Folks...

This email is mostly about Windows 10...

Most of you received an email I sent out last year in August, Windows 10 had come out and I wanted everyone to wait until at least after the first of the year to consider moving to Windows 10...Every time Microsoft brings out a new operating system, there are always problems...and I wanted to wait at least 5-6 months before installing it...

I have tested it, worked with it on some client's computers and I can now say that...

there is **no significant reason to move to Windows 10**...Windows 7 is going to be around for at least 5 more years...(that time will depend on how quickly large businesses move to Windows 10)...and right now there is not noticeable movement...

And if you have Windows 8...this will also be around for about 5 more years...

If you really do not like Windows 8...then we can justify upgrading to Windows 10...

BUT...before you do that...talk to me first...there are some do's and don'ts you should be aware of...

The best situation is to wait until you are ready for a new computer...

Then get Windows 10...

I've been getting quite a few calls about the pop-ups trying to make you install Windows 10...and after a while Microsoft will automatically install Windows 10 whether you agree to it or not...

**My experience with installing Windows 10 on top of either Windows 7 or 8 is NOT GOOD**...There is about a 20% chance that the install will not work and the fix is NOT very easy...a number of times I have had to completely rebuild the computer from scratch to get things working...That's an expense you don't want and don't need...

I have a utility that can block the installation of Windows 10...I can install this utility for \$25 and I can do it remotely...If interested toss me an email for the details...

Enough on that...

You may have heard of the millions of email address that have been recently stolen...

272 million unique email addresses have been stolen...40 million from Yahoo, 33 million from Hotmail/Outlook and 24 million from Gmail...the rest from other, smaller email sites, mostly in Europe and the Middle East...

**CHANGE YOUR EMAIL PASSWORD ASAP...**

Let's avoid the possibility of your email address getting hacked...Each email site has their own requirements for password complexity...Usually when changing a password there will be a small block next to the line where you enter the new password telling the minimum number of characters etc...follow those guidelines...

Use lower case, capital letters, numbers and special characters like %, #, \* etc...the longer the password the better...go for 14 characters or more...and make sure it does

**NOT spell any word you can find in a dictionary**...I consider this to be a very important thing to do...

**WRITE OUT THE NEW PASSOWRD IT IN A WORD DOCUMENT IN LARGE BOLD LETTERS**...print it out and keep it someplace where you can get to it easily...

Then get Windows 10...

I've been getting quite a few calls about the pop-ups trying to make you install Windows 10...and after a while Microsoft will automatically install Windows 10 whether you agree to it or not...

**My experience with installing Windows 10 on top of either Windows 7 or 8 is NOT GOOD**...There is about a 20% chance that the install will not work and the fix is NOT very easy...a number of times I have had to completely rebuild the computer from scratch to get things working...That's an expense you don't want and don't need...

I have a utility that can block the installation of Windows 10...I can install this utility for \$25 and I can do it remotely...If interested toss me an email for the details...

Enough on that...

You may have heard of the millions of email address that have been recently stolen...

272 million unique email addresses have been stolen...40 million from Yahoo, 33 million from Hotmail/Outlook and 24 million from Gmail...the rest from other, smaller email sites, mostly in Europe and the Middle East...

**CHANGE YOUR EMAIL PASSWORD ASAP...**

Let's avoid the possibility of your email address getting hacked...Each email site has their own requirements for password complexity...Usually when changing a password there will be a small block next to the line where you enter the new password telling the minimum number of characters etc...follow those guidelines...

Use lower case, capital letters, numbers and special characters like %, #, \* etc...the longer the password the better...go for 14 characters or more...and make sure it does

**NOT spell any word you can find in a dictionary**...I consider this to be a very important thing to do...

**WRITE OUT THE NEW PASSWRD IT IN A WORD DOCUMENT IN LARGE BOLD LETTERS**...print it out and keep it someplace where you can get to it easily...

Beefeater25 is NOT a good password...8Un66p@ev2%aFG39 is a VERY good password...

If you need help with this...give me a call...

That's it for now...will try to do another newsletter this fall...

As always...if you need, call...J

Folks...

This email is mostly about Windows 10...

Most of you received an email I sent out last year in August, Windows 10 had come out and I wanted everyone to wait until at least after the first of the year to consider moving to Windows 10...Every time Microsoft brings out a new operating system, there are always problems...and I wanted to wait at least 5-6 months before installing it...

I have tested it, worked with it on some client's computers and I can now say that...

there is **no significant reason to move to Windows 10**...Windows 7 is going to be around for at least 5 more years...(that time will depend on how quickly large businesses move to Windows 10)...and right now there is not noticeable movement...

And if you have Windows 8...this will also be around for about 5 more years...

If you really do not like Windows 8...then we can justify upgrading to Windows 10...

BUT...before you do that...talk to me first...there are some do's and don'ts you should be aware of...

The best situation is to wait until you are ready for a new computer...

Then get Windows 10...

I've been getting quite a few calls about the pop-ups trying to make you install Windows 10...and after a while Microsoft will automatically install Windows 10 whether you agree to it or not...

**My experience with installing Windows 10 on top of either Windows 7 or 8 is NOT GOOD**...There is about a 20% chance that the install will not work and the fix is NOT very easy...a number of times I have had to completely rebuild the computer from scratch to get things working...That's an expense you don't want and don't need...

# The Worst

Site / Operator	Year	Compromised Accounts
Adobe Systems	2013	152 Million
Heartland Payment Systems	2008-2009	130 Million
Target Stores	2013	110 Million
Sony PlayStation Network	2011	102 Million
Anthem Healthcare	2015	69 Million
US Government Office of Personnel Management	2015	50+ Million
Home Depot	2013	50 Million
TJX Companies	2011	46 Million

OK, we get it.

What's some good  
advice about protecting your  
passsswords?

## **CHANGE YOUR EMAIL PASSWORD ASAP...**

Let's avoid the possibility of your email address getting hacked...Each email site has their own requirements for password complexity...

Usually when changing a password there will be a small block next to the line where you enter the new password telling the minimum number of characters etc...follow those guidelines...

Use lower case, capital letters, numbers and special characters like %, #, \* etc...the longer the password the better...go for 14 characters or more...and make sure it does NOT spell any word you can find in a dictionary...I consider this to be a very important thing to do...

Sounds good!

Any suggestions on how to  
manage those difficult passwords?

**WRITE OUT THE NEW  
PASSWORD [sic] IT [sic] IN A  
WORD DOCUMENT IN LARGE  
BOLD LETTERS...print it out  
and keep it someplace where  
you can get to it easily...**

Uh-oh.

**Beefeater25 is NOT a good password...**

**8Un66p@ev2%aFG39 is a VERY good password...**

Does anyone see any potential problems with this approach?

Just a few I can think of...

# Just a few I can think of...

- Although “8Un66p@ev2%aFG39” may be a very good password, there is ZERO chance you are going to type it in correctly 20 times a day, or even ONCE

# Just a few I can think of...

- Although “8Un66p@ev2%aFG39” may be a very good password, there is ZERO chance you are going to type it in correctly 20 times a day, or even ONCE
- Let’s not even ***talk*** about ***PRINTING OUT*** our passwords on paper and keeping it “*someplace where you can get to it easily...*”

...and then, there's this:

...and then, there's this:

- Storing passwords in an unencrypted Word document (or any other kind of document) opens you up to a world of hurt:

# ...and then, there's this:

- Storing passwords in an unencrypted Word document (or any other kind of document) opens you up to a world of hurt:
- Computer failure = lose everything

# ...and then, there's this:

- Storing passwords in an unencrypted Word document (or any other kind of document) opens you up to a world of hurt:
  - Computer failure = lose everything
  - Computer trojan exfiltrates your data = you are totally hosed

# ...and then, there's this:

- Storing passwords in an unencrypted Word document (or any other kind of document) opens you up to a world of hurt:
  - Computer failure = lose everything
  - Computer trojan exfiltrates your data = you are totally hosed
  - You trash the document = you are stuffed

# ...and then, there's this:

- Storing passwords in an unencrypted Word document (or any other kind of document) opens you up to a world of hurt:
  - Computer failure = lose everything
  - Computer trojan exfiltrates your data = you are totally hosed
  - You trash the document = you are stuffed
  - But it makes things nice and easy for anyone who has physical access to your machine

...and maybe a few more:

...and maybe a few more:

- What if you're not at home / don't have access to the document?

# ...and maybe a few more:

- What if you're not at home / don't have access to the document?
- You still have to copy-and-paste User IDs & passwords into web pages, login forms, etc.

# ...and maybe a few more:

- What if you're not at home / don't have access to the document?
- You still have to copy-and-paste User IDs & passwords into web pages, login forms, etc.
- Does not protect against shoulder surfing or key loggers

# ...and maybe a few more:

- What if you're not at home / don't have access to the document?
- You still have to copy-and-paste User IDs & passwords into web pages, login forms, etc.
- Does not protect against shoulder surfing or key loggers
- It's just the wrong wrong wrong wrong wrong tool for the job

## SUPPORT THE COVE APPLE CLUB WHEN YOU SHOP AT AMAZON.COM

The next time you need some new Apple or other tech gear (or anything else from the 20,000,000 items in stock!), start your online shopping session with our link to Amazon.com. Your purchase will earn a little money for the Cove Apple Club, which we save up all year for a big Holiday Party for all members of the club! We update club members on the earnings every month.

So be sure to click the Amazon logo below when you need to shop for Mac products online...and “give back” to the Cove Apple Club -- without costing you an extra cent! Thanks!

### THREE EASY WAYS TO USE THE AMAZON SHOPPING LINK

1. Just click here — you'll be sent to the Amazon.com homepage.
  1. Once you arrive at the Amazon homepage, BOOKMARK that page:
    1. In Safari on Mac, type Cmd-D
    2. In Safari on iOS, tap the Share widget, then tap Add to Favorites or Add Bookmark.
2. Drag this link to your Favorites bar in your Web browser. Then it's handy anytime you want to visit Amazon.
3. Just click the Amazon banner ad below.

Monday, December 2, 2013

A photograph showing the interior of a severely damaged building, likely a house, after a fire. The floor is covered in dark, charred debris and ash. In the center, there is a large, rectangular, rusted metal box or safe. To the left, a black electronic device, possibly a television or monitor, is partially visible. In the background, there are more pieces of debris, including what looks like a metal frame and some wooden planks. The overall scene is one of destruction and decay.

All The Freakish Details...

# All The Freakish Details...

## Verify Your Backups!

by Mike Sullivan | Cove Apple Club | Updated May, 2016  
“The best time to practice emergency procedures is during non-emergency conditions.”

Those words, said to me by my first flight instructor, hold very true in the world of computer data backup and recovery. It just makes sense to practice your emergency data-recovery procedures before you need to use them. Then, when the worst happens, or you just accidentally delete an entire folder of important documents one day, you'll know what to do to recover your valuable data.

### Preparing to Verify Your Backups: Do This a Few Days Before Your Test

1. In Finder on your Mac, click on the Go menu and choose Documents
2. With the Documents window open in the Finder, click on the File menu, then choose “New Folder”
3. In the new folder item label, type “Test Recovery Data” and press Enter to name the new folder
4. **While holding down the Option key**, drag a few items from your Documents folder into the new Test Recovery Data folder: a few **SMALL, non-confidential** PDFs, photos, a music file or two. Holding down the Option key while you drag the items creates copies of the files into the test folder. That way, none of your original files are at risk during the test. Ideally, you want about 10Mb of data in the test folder, but just so you have a mix of items of various kinds and sizes, you're ready to move on.
5. Now forget about the test folder for a few days. While you use your machine normally day-to-day, your established backup routines should run without your attention, and your test folder should be backed up automatically.
  - Time Machine will backup a copy of the new test folder during its next hourly “snapshot”
  - Your daily Carbon Copy Cloner whole-disk bootable clone process should backup a copy of the new test folder during its next scheduled run.
  - BackBlaze should make a backup a copy of the new test folder during its next hourly “snapshot”
6. Once you've given your established backup systems a day or two to do their work, delete the Test Recovery Data folder by dragging it to Trash.
7. Finally, from the Finder menu, choose Empty Trash.

### Use Time Machine to Recover Your Test Folder

1. In Finder, click on the Go menu and choose Documents. To use Time Machine to recover folders or files, you first must navigate in the Finder to the window where your deleted file or folder **was**. For example, if you accidentally deleted a file from your Documents folder, open the Documents folder. To recover an email message, open your inbox in Mail. If you're missing an item from the desktop, you don't need to open a window.
2. From the Time Machine menu in the menu bar, choose Enter Time Machine. A message may appear while your Mac connects to the backup disk.
3. Use the arrows and timeline to browse the snapshots and backups.
4. White tick marks represent snapshots stored on your internal drive (portable computers only). Pink tick marks represent backups stored on your backup disk. If a tick mark appears dimmed or grayed, there's no backup available or the backup disk is not connected.
5. For more information about an item, double-click it.
6. The windows in Time Machine behave just like Finder windows, so you can open folders, click items in the sidebar, and use the search field in the upper-right corner of the window.
7. When you find the item you want to restore, select it, then click Restore. You can restore individual items, multiple items, folders, or your entire hard disk.
8. The restored item is returned to its original location. For example, if the item was found in the Documents folder, it is returned to the Documents folder.
9. Verify that the restored folder again, and empty Trash to prepare for the next recovery test.
10. Finally, Trash the test folder again, and empty Trash to prepare for the next recovery test.

### Boot Your Mac from the Carbon Copy Cloner Bootable Whole-Disk Clone

1. Shut down your Mac. From the Apple menu, choose Shut Down.
2. Press the power button on your Mac, and then immediately hold down the Option key on the keyboard.

3. Continue holding the Option key until you see the Startup Manager screen on your Mac.
4. Use the left and right arrow keys on your keyboard to select the external drive containing your CCC Bootable Clone.
5. Press the Return key on your keyboard to start up the computer from the volume you selected.
6. Your Mac should boot up from the external clone drive. Once it boots, your Mac should behave exactly like it always does, with all your Apps, files and folders exactly as they were the last time the CCC scheduled clone routine made its copy.
7. Verify that the Test Recovery Data folder is in the Documents folder.
8. From the Apple Menu, choose Shut down
9. Press the power button on your Mac and it will start up normally from the internal Macintosh HD.

### Recover From Your Backblaze Off-Site Backup

1. In Safari, go to [www.backblaze.com](http://www.backblaze.com), then click “Sign In to Restore” at the top-right of the BackBlaze home page.
2. Enter your email address and your BackBlaze password, then click the big blue “Restore” button.
3. Find your Mac listed in the Overview section, and click the big blue “Restore” button.
4. Wait while BackBlaze loads your data and builds a file directory for you to choose files to restore.
5. In the Folders column, click on **Macintosh HD**, then click **Users**, then click on your Home folder account name, then scroll down if needed and click **Documents**, then scroll down to find your **Test Recovery Folder**.
6. Click the checkbox next to your Test Recovery Folder to select it to be restored.
7. Click “Continue with Restore”
8. Keep the BackBlaze window open in Safari while BackBlaze locates and prepares your restore file. You will receive an email message when your file is ready to be downloaded. For a small file like your Test Recovery Folder, it should only take a minute or two. While you're waiting, you can click on the Account link in BackBlaze and verify your subscription end date and billing info to make sure it is correct and up-to-date.
9. Click on My Restores
10. Find your restore file in the list of files to be downloaded
11. Click the Download button to download your restored file.
12. Click Sign Out to sign out of BackBlaze
13. From the Finder menu, choose Go, then click on Downloads
14. Find the downloaded .ZIP file with your BackBlaze restore and double-click it to un-Zip the compressed file.
15. Double-click the Macintosh HD folder created from the de-compressed restore file, then open each of the subsequent enclosing folders to find your Test Recovery Folder
16. Verify that your test files are inside the Test Recovery Folder

**Make sure to keep a secure, replicated, encrypted, off-site, backed-up copy of your BackBlaze account info, including your subscription renewal date.** Ideally, this will be kept in a Secure Note inside the password app ([www.iPassword.com](http://www.iPassword.com)) on your Mac, iPhone or iPad.
